WORK EXPERIENCE

PANASONIC

AUG/2022 - NOW

MECHANICAL DESIGN

Perform a full life-cycle of a project: Collect requirements, design and assembly, maintenance and continuous improvement. Ensure that the machines are designed to meet performance, safety, and reliability criteria.

- **Research and Development:** Create new prototypes and concepts, and test mechanisms while offering a practical approach to the subject. Identify deficiencies in technical processes and collaborate with other departments to contribute ideas and solutions for handling technical problems.
- **Design:** Consider important factors such as cost, output, safety, space, and size to design machines, jigs, and fixtures that meet project objectives.
- **Assembly:** Demonstrate the ability to use various types of processing tools and hand tools while comprehending the equipment.
- **Maintenance:** Ensure a smooth production flow with scheduled maintenance, troubleshoot issues, and prepare spare parts to minimize downtime caused by machines or systems.
- **Continuous Improvement:** Maximize system performance, improve efficiency up to 90%, and reduce the production nonconformance ratio to 0.01%.

PRODUCTION ASSEMBLY ENGINEER

- **Manage the production line:** Ensure that the production status aligns with the production plan. Identify and minimize MUDA in production.
- **Quality assurance:** Ensure that ongoing operations adhere to quality system procedures. Implement necessary actions to meet planned quality objectives. Address customer complaints and NCR reports while improving processes. Frequently review and update.
- **ISO documentation:** Standardize the Control Process Chart (CP), Work Instructions (WI), and checklists for initial, in-process, and finished goods, as well as check sheets.
- **Team development:** Train operators to understand the process and comply with safety regulations in the workplace.

EDUCATION & CERTIFICATE

VSVC College graduate as a mechanical technician, Wall Street English certificate level B2, SolidWorks certificate for mechanical design.

SKILLS

CAD: Proficiency in SolidWorks, AutoCAD, GD&T, 3D printing.

Lean Manufacturing: 4M3H, 5S3T, Kaizen, Kanban, PDCA, One piece flow, 5Why analysis, 7 QC tools, TPM, ...

Programming: Laser marking, PLC, Arduino.

PROCESS AND ACHIEVEMENTS

Motor's Cover Cleaning Machine:

Achieved: Automatic process from cleaning by hand to fully automatic. Reduce takt time from 10s to 4s.
Reduce 1-2 operators. Reduce costs by purchasing cleaning rags.

Accessory Pressing Machine

Achieved: Complete within 3 weeks
Before: Use 2-3 jigs to assemble all parts
After: Use 1 machine for assembly
Reduce takt time by a half. Space saving.

Rotor E-ring Insert and Paint combined with Pick and Place arm machine

Achieved: Combined 3 processes include E-ring insert, Paint and Packing Rotor into 1 machine.

Hex Nut Insertion Machine

Achieved: Reduced takt time. No missing part
=> Quality up to 100%

And various machines, jigs
